Contact Aquafine

As the world's leading UV water treatment equipment providers, Aquafine is committed to providing customers with the best performance products and continues to improve the user experience.

The universal controller is an important upgrade for existing controllers. It provides improved readability and operation interface and maintenance capability, in addition to improved functionality and configurations.

Our new universal controller provides the following benefits:

Maximum versatility

The microprocessor is designed with a diverse set of flexible components; helps combine existing LCD, HOA, LOA and RTM into one standard controller; offers flexibility and standardization of the controller across product lines; and capability for future upgrades and expansions.

Ease of use and confidence in results

Ease of use and confidence in results: high-resolution graphic display allows for optimal viewing of color lamp status, number of lamps hours and real-time UV intensity; easy and reliable software upgrades for future improvements and product enhancements; and high industrial standard design provides improved product reliability with reduced warranty and monitoring station failures.

One controller – different options

One controller with different options: Configuration options based on customer requirements, providing simplified selections and future upgrade opportunities.
